

The DOM Event Path and Delegation

One click travels down to the deepest element, then back up. Listening high up is delegation.

Inside the one handler on the `<ul>`
`event.target`: the `<button>` actually clicked
`event.currentTarget`: the `<ul>` you listened on

That gap IS delegation: one listener on the parent handles every child, including ones added later. Pass `true` as the third argument to `addEventListener` to run on the way DOWN instead.
