

The DOM Tree

The browser parses your HTML into a tree of objects. JavaScript changes the tree, not the file.

Reaching into the tree

```
getElementById('list')  
querySelector('#list li')  
querySelectorAll('li')  
closest('ul')
```

querySelectorAll returns a static
NodeList: a snapshot, not live.

window is the global object

```
window.document  
window.location  
window.navigator  
window.localStorage
```

Everything global hangs off it,
so window. is usually optional.
