

Promise States

A promise settles once and stays settled. Every `.then` returns a NEW promise.

Once settled, a promise can never change state or value again.
Attaching `.then` later still fires, with the value it already has.

Each link is a new promise

```
.then(onFulfilled)
```

```
.catch(onRejected)
```

```
.finally(cleanup)
```

Returning a value fulfills the next promise; throwing rejects it. That is why one `.catch` at the end covers the whole chain, and why `.finally` passes the result straight through.

Callbacks you attach are queued as **MICROTASKS**, so they always run after the current synchronous code finishes and before the next timer or DOM event, even when the promise settled long ago.
