

Utility Types as Transforms

One source of truth in, several derived shapes out. Change the interface and every one of them follows.

The point is DERIVATION. Add a field to User and Partial, Pick and Omit all update themselves; hand-written copies drift. They also compose: Partial<Omit<User, 'id'>> is the body of an update request. Note that Pick and Omit accept key names as literal types: misspell one and Pick errors, while Omit silently ignores it.
